

We are proposing a change to the initial wireframe design based on your feedback about the sessions and incidents being connected in a more natural way.

Currently, we have incident history and ride session options on the main screen with those being almost redundant in the data they display. We would like to propose that Incident history be removed and only Ride Sessions will remain. This would lead to the removal of the incident history screen and the Ride Session Detail screen leaving us with just an updated Ride Session screen which would lead to the existing Incident Detail screen and Choose Picture screen.

Below you can see a proposed design to showcase incidents separated by ride sessions in a cleaner way. This would be the new Ride Session screen. Each thumbnail would either show the best selected image for a user-edited incident or an alert telling the user action is required. Each item represents an incident, and the collection can be scrolled horizontally to select different incidents from the session identified by the blue squares which show the date and start time of each session. Sessions with no incidents are still identified as shown to help display the sessions as the user will likely remember them.

By default, sessions would be listed in reverse chronological order showing the most recent session at the top. A filtering system would enable more precise control over what's displayed.

We believe this change will address your concerns from our meeting as well as streamline the user experience by providing a clear path of sessions -> incidents. We also believe that if available, the image a user selects as the best image would be the best indication to the user of which incident is which. Certainly, more than a textbox of time or GPS locations could provide at a glance.

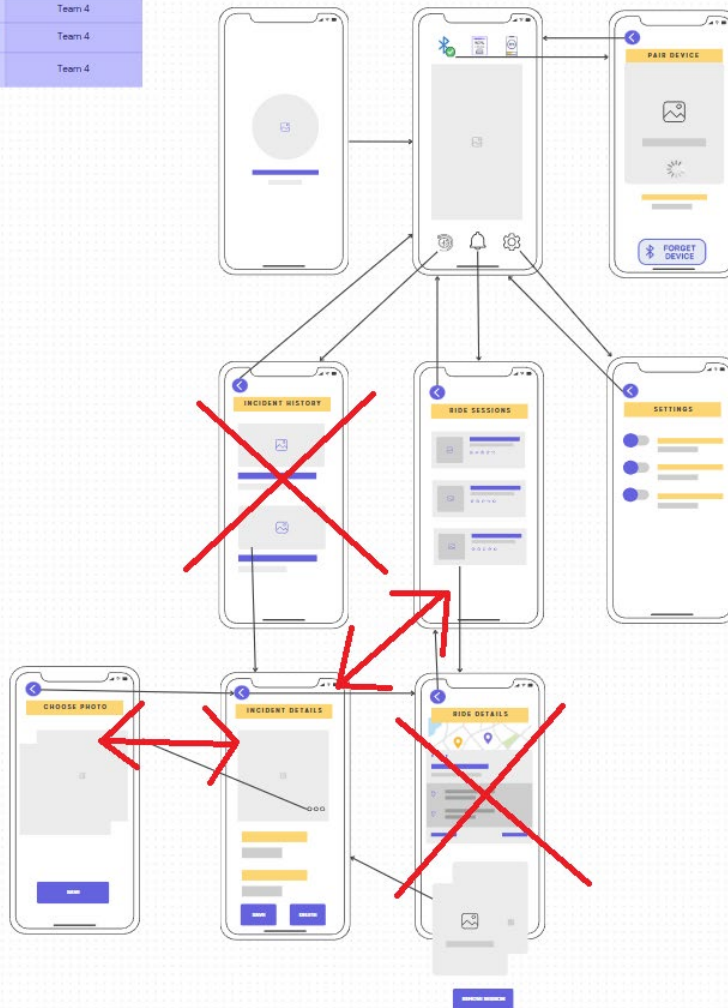

Below you can see a revised wireframe example with this new flow.

Let's end the session with action items.	
Action Item	Point Person
Create an actionable task	Assign the responsibility
Add a category to group ride session into times past (i.e. today, yesterday, a week ago, two weeks ago.)	Team 4
Add an "about this device section" within the bluetooth pairing screen	Team 4
Move "Forget Device" button to bluetooth pairing screen	Team 4
Add a way to remove sessions. Implement with warning screen.	Team 4

Wireframe Review

Mobile

Let's make some decisions about our application's interface.

With this change we also would like to ask you about how long you feel data should remain on the ride session list. Our idea for a default was 30 days after which it would seem clear that a user has done everything they plan to do with an incident. This is something we could put on the settings page to allow a user to choose as well.

Please let us know if you like these ideas or want any different changes and we can pursue that plan!
