

Android Compatibility Report

By Christopher Paquin

The application was evaluated across 5 Android emulator configurations with different screen resolutions, display densities, and operating system versions. It was functionally serviceable in each configuration during the testing. Findings primarily concerned non-functional requirements.

Configuration	Resolution	Density	Android / API	Findings
Small Phone	720 x 1280	320 dpi	17 / 37.2	Functionally serviceable. Excessive empty space near the top of the screen indicates an opportunity to improve layout.
Medium Phone	1080 x 2400	420 dpi	17 / 37.2	Functionally serviceable. Excessive empty space near the bottom of the screen indicates an opportunity to improve layout.
Large Phone	1440 x 3088	480 dpi	17 / 37.2	Functionally serviceable. Layout behavior was effectively the same as the medium phone, including excessive empty space near the bottom.
Small Phone	720, 1280	320 dpi	7 / 24	Functionally serviceable, with the same layout concern as the other small phone configuration. The three-button system navigation bar was visible, and the Back button functioned correctly.
Medium Phone	1080 x 2400	420 dpi	10 / 29	Functionally serviceable, with the same layout concern as the other medium phone configuration. The three-button system navigation bar was visible, and the Back button functioned correctly.

The observed layout issues were consistent by screen size across the tested Android versions. Small phone configurations displayed excessive space above the content, while medium and large configurations displayed excessive space below it. Adjusting content positioning and spacing would improve the use of available screen area.

Two additional problems were identified:

- Filter button contrast: The button displays white text on a white background, making its label difficult to read. Adjust the text or background color to provide clear contrast.
- Combined filter logic: When both filters are selected, the application applies OR logic, returning results that match either condition. The intended behavior is AND logic, returning only results that satisfy both selected conditions.
